Name and Intended Use

Anti-alpha Fodrin IgG/IgA is an indirect solid phase enzyme immunoassay (ELISA) for the quantitative measurement of IgG and IgA class autoantibodies against alpha-Fodrin in human serum or plasma.

Summary and Explanation of the Test

Alpha-Fodrin is an intracellular, actin-binding, organ-specific protein of the cytoskeleton. It is a dimer composed of an alpha- and a beta-subunit. The network of actin and fodrin situated below the plasma membrane of secretorial cells, is important for the alignment of secretorial vesicles to the plasma membrane during secretorial processes. During apoptosis the alpha-fodrin dimer is cleaved into a 120 kDa breakdown product, which is found abundantly in the salivary gland [2, 6]. This proteolysis of fodrin may be a consequence of protease activation during apoptosis [11]. The cleavage product of 120 kDa alpha-fodrin was found to be an important autoantigen in the pathogenesis of organ-specific autoimmune response [8]. Clinical studies have shown, that in patients with Sjogren Syndrome alpha-fodrin is involved in the stimulation of peripheral blood T cells [2]. These findings suggest, that an increase in protease activity and the stimulation of T-cells play an important role in the alpha-fodrin proteolysis during the development of primary Sjogren's Syndrome [7]. The Sjogren's Syndrome is an autoimmune disorder affecting lachrymal and salivary glands (Sicca symptomatic). It is resulting in keratoconjunctivitis and xerostomia sicca. Sjogren's syndrome is elicited by lymphocytic infiltration of the lachrymal and salivary glands [9]. Sicca syndrome frequently affects patients with Grave's ophthalmopathy [13]. Alpha-fodrin autoantibodies are specifically detected in sera of adults affected with primary or secondary Sjoegren's syndrome [2, 5, 12], but they are not found in other autoimmune disorders without sicca symptoms. In contrast to adults, the alpha-fodrin antibody is often present in juvenile SLE and juvenile RA without any signs suggesting secondary Sjoegren's syndrome [10]. During an international congress in 1999 controversial data was presented regarding the prevalence of IgG and IgA antibodies directed against alpha-fodrin. A more recent study demonstrates a significantly higher prevalence of immunoglobulins class IgG [13]. In patients with SLE or Grave's ophthalmopathy and antibodies directed against alpha-fodrin, no correlation was found to antibodies directed against SS-A or SS-B [5, 13]. Kobayashi et al. detected anti-alpha-fodrin autoantibodies before anti-SS-A or anti-SS-B antibodies became positive [4]. Thus, the authors conclude, that anti-alpha-fodrin antibodies could be a useful marker for the early diagnosis of SS. The detection of anti-alpha-fodrin antibodies can prove to be a useful sensitive and specific marker for Sjoegren's syndrome, particularly during the early stages of the pathogenesis of Sjoegren's syndrome and even for diagnosis of juvenile SLE and RA. It has been shown that alpha-fodrin antibodies can be detected earlier than SS-A or SS-B. Clinical trials indicate that routine screening for alpha-fodrin antibodies is a valuable tool for the diagnosis of Sjoegren's syndrome in adults with sicca symptoms and even for the determination of juvenile Sjoegren's syndrome, SLE and RA. According to the latest findings, routine screening for antibodies directed against alpha-fodrin are a useful tool to diagnose Sjoegren's syndrome in an early stage.
**Principle of the Test**

Human alpha-Fodrin is bound to microwells. Antibodies to this antigen, if present in diluted serum, bind in the microwells. Washing of the microwells removes unbound serum antibodies. Horseradish peroxidase (HRP) conjugated anti-human IgG or IgA immunologically bind to the bound patient antibodies forming a conjugate/antibody/antigen complex. Washing of the microwells removes unbound conjugate. An enzyme substrate in the presence of bound conjugate hydrolyzes to form a blue color. The addition of an acid stops the reaction forming a yellow end-product. The intensity of this yellow color is measured photometrically at 450 nm. The amount of colour is directly proportional to the concentration of IgG resp. IgA antibodies present in the original sample.

**Warnings and Precautions**

1. All reagents of this kit are strictly intended for research use only.
2. Do not interchange kit components from different lots.
3. Components containing human serum were tested and found negative for HBsAg and HIV by FDA approved methods. No test can guarantee the absence of HBsAg or HIV, and so all human serum based reagents in this kit must be handled as though capable of transmitting infection.
4. Avoid contact with the TMB (3, 3’, 5, 5´-Tetramethyl-benzidine). If TMB comes into contact with skin, wash thoroughly with water and soap.
5. Avoid contact with the Stop Solution which contains hydrochloric acid (1 M). If it comes into contact with skin, wash thoroughly with water and seek medical attention.
6. Some kit components (i.e. Controls, Sample buffer and Buffered Wash Solution) contain Sodium Azide as preservative. Sodium Azide (NaN₃) is highly toxic and reactive in pure form. At the product concentrations, though not hazardous. Despite the classification as non-hazardous, we strongly recommend using prudent laboratory practices (see 8, 9, 10)
7. Some kit components contain Proclin 300 as preservative. When disposing reagents containing Proclin 300, flush drains with copious amounts of water to dilute the components below active levels.
8. Wear disposable gloves while handling specimens or kit reagents and wash hands thoroughly afterwards.
9. Do not pipette by mouth.
10. Do not Eat, Drink, Smoke or Apply Makeup in areas where specimens or kit reagents are handled.
11. Avoid contact between the buffered Peroxide Solution and easily oxidized materials, extreme temperature may initiate spontaneous combustion.

Observe the guidelines for performing quality control in medical laboratories by assaying controls and/or pooled sera. During handling of all kit reagents, controls and serum samples observe the existing legal regulations.

### Storage and Stability

1. Store the kit at 2-8°C.
2. Keep microplate wells sealed in a dry bag with desiccants.
3. The reagents are stable until expiration of the kit.
4. Do not expose test reagents to heat, sun or strong light during storage and usage.
5. Diluted sample buffer and wash buffer are stable for at least 30 days when stored at 2-8°C.

### Materials Required

#### Equipment
- Microplate reader capable of endpoint measurements at 450 nm
- Multi-Channel Dispenser or repeatable pipet for 100 µl
- Vortex mixer
- Pipets for 10 µl, 100 µl and 1000 µl
- Laboratory timing device
- Data reduction software
Preparation of reagents
- distilled or deionized water
- graduated cylinder for 100 and 1000 ml
- plastic container for storage of the wash solution

Specimen Collection, Storage and Handling

1. Collect whole blood specimens using acceptable medical techniques to avoid hemolysis.
2. Allow blood to clot and separate the serum by centrifugation.
3. Test serum should be clear and non-hemolyzed. Contamination by hemolysis or lipemia is best avoided, but does not interfere with this assay.
4. Specimens may be refrigerated at 2-8°C for up to five days or stored at -20°C up to six months.
5. Avoid repetitive freezing and thawing of serum samples. This may result in variable loss of autoantibody activity.
6. Testing of heat-inactivated sera is not recommended.

Procedural Notes

1. Do not use kit components beyond their expiration dates.
2. Do not interchange kit components from different lots.
3. All materials must be at room temperature (20-28°C).
4. Have all reagents and samples ready before start of the assay. Once started, the test must be performed without interruption to get the most reliable and consistent results.
5. Perform the assay steps only in the order indicated.
6. Always use fresh sample dilutions.
7. Pipette all reagents and samples into the bottom of the wells.
8. To avoid carryover contaminations change the tip between samples and different kit controls.
9. It is important to wash microwells thoroughly and remove the last droplets of wash buffer to achieve best results.
10. All incubation steps must be accurately timed.
11. Control sera or pools should routinely be assayed as unknowns to check performance of the reagents and the assay.
12. Do not re-use microplate wells.

For all controls, the respective concentrations are provided on the labels of each vial. Using these concentrations a calibration curve may be calculated to read off the patient results semi-quantitatively.
Preparation of Reagents

Preparation of sample buffer
Dilute the contents of each vial of the sample buffer concentrate (5x) with distilled or deionized water to a final volume of 100 ml prior to use. Store refrigerated: stable at 2-8°C for at least 30 days after preparation or until the expiration date printed on the label.

Preparation of wash solution
Dilute the contents of each vial of the buffered wash solution concentrate (50x) with distilled or deionized water to a final volume of 1000 ml prior to use. Store refrigerated: stable at 2-8°C for at least 30 days after preparation or until the expiration date printed on the label.

Sample preparation
Dilute all patient samples 1:100 with sample buffer before assay. Therefore combine 10 µl of sample with 990 µl of sample buffer in a polystyrene tube. Mix well. Controls are ready to use and need not be diluted.

Test Procedure

1. Prepare a sufficient number of microplate modules to accommodate controls and prediluted patient samples.
2. Pipette 100 µl of controls and prediluted patient samples in duplicate into the wells.

3. Incubate for 30 minutes at room temperature (20-28°C).
4. Discard the contents of the microwells and wash 3 times with 300 µl of wash solution.
5. Dispense 100 µl of enzyme conjugate into each well.
6. Incubate for 15 minutes at room temperature.
7. Discard the contents of the microwells and wash 3 times with 300 µl of wash solution.
8. Dispense 100 µl of TMB substrate solution into each well.
9. Incubate for 15 minutes at room temperature.
10. Add 100 µl of stop solution to each well of the modules and incubate for 5 minutes at room temperature.

Alpha Fodrin Ab IgG/IgA ELISA Kit (Cat # KA1087 V.01)
For research use only
11. Read the optical density at 450 nm and calculate the results. Bi-chromatic measurement with a reference at 600-690 nm is recommended.

The developed color is stable for at least 30 minutes. Read optical densities during this time.

Automation
The Anti-alpha-Fodrin IgG/IgA ELISA is suitable for use on open automated ELISA processors. The test procedure detailed above is appropriate for use with or without automation.

Interpretation of Results

Quality Control
This test is only valid if the optical density at 450 nm for Positive Control (1 resp. 2) and Negative Control (3) as well as for the Calibrator A and F complies with the respective range indicated on the Quality Control Certificate enclosed to each test kit! If any of these criteria is not met, the results are invalid and the test should be repeated.

Calculation of results
For Anti-alpha-Fodrin IgG and IgA a 4-Parameter-Fit with lin-log coordinates for optical density and concentration is the data reduction method of choice. Smoothed Spline Approximation and log-log coordinates are also suitable.

Recommended Lin-Log Plot
First calculate the averaged optical densities for each calibrator well. Use lin-log graph paper and plot the averaged optical density of each calibrator versus the concentration. Draw the best fitting curve approximating the path of all calibrator points. The calibrator points may also be connected with straight line segments. The concentration of unknowns may then be estimated from the calibration curve by interpolation.

Interpretation of results
In a normal range study with serum samples from healthy blood donors the following ranges have been established with the Anti-alpha-Fodrin tests:

<table>
<thead>
<tr>
<th>Anti-alpha-Fodrin IgG/IgA [U/ml]</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Negative:</td>
<td>&lt; 10</td>
</tr>
<tr>
<td>positive:</td>
<td>&gt; 10</td>
</tr>
</tbody>
</table>
Positive results should be verified concerning the entire clinical status of the patient. Also every decision for therapy should be taken individually. It is recommended that each laboratory establishes its own normal and pathological ranges of serum anti-alpha-Fodrin.

**Performance Characteristics**

**Parallelism**

In dilution experiments sera with high antibody concentrations were diluted with sample buffer and assayed in the Anti-alpha-Fodrin kit. The assay shows linearity over the full measuring range.

**Precision (Reproducibility)**

Statistics for Coefficients of variation (CV) were calculated for each of three samples from the results of 24 determinations in a single run for Intra-Assay precision. Run-to-run precision was calculated from the results of 6 different runs with 24 determinations each:

<table>
<thead>
<tr>
<th>Sample No</th>
<th>Mean [U/ml]</th>
<th>CV (%)</th>
<th>Sample No</th>
<th>Mean [U/ml]</th>
<th>CV (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>15.9</td>
<td>4.0</td>
<td>1</td>
<td>15.7</td>
<td>2.9</td>
</tr>
<tr>
<td>2</td>
<td>59.0</td>
<td>4.0</td>
<td>2</td>
<td>58.1</td>
<td>1.1</td>
</tr>
<tr>
<td>3</td>
<td>137.0</td>
<td>2.2</td>
<td>3</td>
<td>144.0</td>
<td>3.4</td>
</tr>
</tbody>
</table>

**Sensitivity**

The lower detection limits for Anti-alpha-Fodrin IgG/IgA was determined at 1.0 U/ml.

**Specificity**

The microplate is coated with human alpha-Fodrin. The Anti-alpha-Fodrin test kit recognises only autoantibodies specific to the alpha-Fodrin.

**Calibration**

Since no international reference preparation for anti-alpha-Fodrin autoantibodies is available, the assay is calibrated in relative arbitrary units.

**Limitations of Procedure**

The Anti-alpha-Fodrin IgG/IgA ELISA is a diagnostic aid and by itself is not diagnostic. A definite clinical diagnosis should not be based on the results of a single test, but should be made by the physician after all clinical and laboratory findings have been evaluated.

A negative Anti-alpha-Fodrin result does not rule out the presence of Sjoegren’s syndrome.

Alpha Fodrin Ab IgG/IgA ELISA Kit (Cat # KA1087 V.01)
For research use only
Interfering Substances

No interference has been observed with haemolytic (up to 1000 mg/dL), lipemic (up to 3 g/dL triglycerides) or bilirubin (up to 40 mg/dL) containing sera. Nor have any interfering effects been observed with the use of anticoagulants. However for practical reasons it is recommended that grossly hemolyzed or lipemic samples be avoided.

References

Incubation Scheme

1. Pipet 100 μl calibrator, control or patient sample
   Incubate for **30 minutes** at room temperature
   Discard the contents of the wells and wash 3 times with 300 μl wash solution

2. Pipet 100 μl enzyme conjugate
   Incubate for **15 minutes** at room temperature
   Discard the contents of the wells and wash 3 times with 300 μl wash solution

3. Pipet 100 μl substrate solution
   Incubate for **15 minutes** at room temperature

4. Add 100 μl stop solution
   Leave untouched for **5 minutes**
   Read at **450 nm**
