ELISA PRODUCT INFORMATION & MANUAL

TNF-alpha
NBP2-31085

Enzyme-linked Immunosorbent Assay for quantitative detection of Mouse TNF-alpha. For research use only. Not for diagnostic or therapeutic procedures.

Novus kits are guaranteed for 6 months from date of receipt
Mouse TNF alpha ELISA

Enzyme-linked Immunosorbent Assay for quantitative detection of mouse TNF α

Catalog Numbers NBP2-31085

**Product description**

The Mouse TNF alpha ELISA is an enzyme-linked immunosorbent assay for the quantitative detection of mouse TNF alpha. Cell culture supernatant, serum, and plasma (EDTA, citrate) have been tested with this assay.

TNF alpha is a multifunctional cytokine involved in many different pathways, in homeostasis and pathophysiology of mammals. It can show opposing biological effects suggesting complex regulatory mechanisms. TNF alpha, also known as cachectin, was first detected as a cytotoxic factor inducing lysis of certain tumor cells. The TNF alpha gene is member 2 of the TNF-superfamily (consisting of at least 20 distinct members).

**Principles of the test**

An anti-mouse TNF alpha coating antibody is adsorbed onto microwells.

---

**Fig. 1 Coated microwell**

Mouse TNF alpha present in the sample or standard binds to antibodies adsorbed to the microwells and a biotin-conjugated anti-mouse TNF alpha antibody is added and binds to mouse TNF alpha captured by the first antibody.

---

**Fig. 2 First incubation**

Following incubation, unbound biotin-conjugated anti-mouse TNF alpha antibody is removed during a wash step. Streptavidin-HRP is added and binds to the biotin-conjugated anti-mouse TNF alpha antibody.

---

**Fig. 3 Second incubation**

Following incubation, unbound Streptavidin-HRP is removed during the wash step, and substrate solution reactive with HRP is added to the wells.

---

**Fig. 4 Third incubation**

A coloured product is formed in proportion to the amount of TNF alpha present in the sample or standard. The reaction is terminated by addition of acid and absorbance is measured at 450 nm. A standard curve is prepared from 7 TNF alpha standard dilutions and TNF alpha sample concentration determined.

---

**Fig. 5 Stop reaction**

For Research Use Only. Not for use in diagnostic procedures.
Reagents provided

Reagents for mouse TNF alpha ELISA NBP2-31085 (96 tests)
1 aluminum pouch with a Microwell Plate coated with monoclonal antibody to mouse TNF alpha
1 vial (70 µL) Biotin-Conjugate anti-mouse TNF alpha polyclonal antibody
1 vial (150 µL) Streptavidin-HRP
2 vials mouse TNF alpha Standard lyophilized, 2 ng/mL upon reconstitution
1 bottle (5 mL) Calibrator Diluent
1 bottle (12 mL) Sample Diluent
1 vial (5 mL) Assay Buffer Concentrate 20x (PBS with 1% Tween® 20, 10% BSA)
1 bottle (50 mL) Wash Buffer Concentrate 20x (PBS with 1% Tween® 20)
1 vial (15 mL) Substrate Solution (tetramethyl-benzidine)
1 vial (15 mL) Stop Solution (1M Phosphoric acid)
4 Adhesive Films

Reagents for mouse TNF alpha ELISA NBP2-31085 (10 x 96 tests)
10 aluminum pouches with a Microwell Plate coated with monoclonal antibody to mouse TNF alpha
10 vials (70 µL) Biotin-Conjugate anti-mouse TNF alpha polyclonal antibody to mouse TNF alpha
10 vials (150 µL) Streptavidin-HRP
10 vials mouse TNF alpha Standard lyophilized, 2 ng/mL upon reconstitution
5 bottles (5 mL) Calibrator Diluent
6 bottles (12 mL) Sample Diluent
2 vials (5 mL) Assay Buffer Concentrate 20x (PBS with 1% Tween® 20, 10% BSA)
7 bottles (50 mL) Wash Buffer Concentrate 20x (PBS with 1% Tween® 20)
10 vials (15 mL) Substrate Solution (tetramethyl-benzidine)
1 vial (100 mL) Stop Solution (1M Phosphoric acid)
20 Adhesive Films

Storage instructions - ELISA kit

Store kit reagents between 2°C and 8°C. Immediately after use remaining reagents should be returned to cold storage (2°C to 8°C). Expiry of the kit and reagents is stated on labels. Expiry of the kit components can only be guaranteed if the components are stored properly, and if, in case of repeated use of one component, this reagent is not contaminated by the first handling.

Sample collection and storage instructions

Cell culture supernatant, serum and plasma (EDTA, citrate) were tested with this assay. Other biological samples might be suitable for use in the assay. Remove serum or plasma from the clot or cells as soon as possible after clotting and separation. Samples containing a visible precipitate must be clarified prior to use in the assay. Do not use grossly hemolyzed or lipemic samples. Samples should be aliquoted and must be stored frozen at –20°C to avoid loss of bioactive mouse TNF alpha. If samples are to be run within 24 hours, they may be stored at 2–8°C. Avoid repeated freeze-thaw cycles. Prior to assay, the frozen sample should be brought to room temperature slowly and mixed gently.

Materials required but not provided

- 5 mL and 10 mL graduated pipettes
- 5 µL to 1000 µL adjustable single channel micropipettes with disposable tips
- 50 µL to 300 µL adjustable multichannel micropipette with disposable tips
- Multichannel micropipette reservoir
- Beakers, flasks, cylinders necessary for preparation of reagents
- Device for delivery of wash solution (multichannel wash bottle or automatic wash system)
- Microwell strip reader capable of reading at 450 nm (620 nm as optional reference wave length)
- Glass-distilled or deionized water
- Statistical calculator with program to perform regression analysis

Precautions for use

- All chemicals should be considered as potentially hazardous. We therefore recommend that this product is handled only by those persons who have been trained in laboratory techniques and that it is used in accordance with the principles of good laboratory practice. Wear suitable protective clothing such as laboratory overalls, safety glasses, and gloves. Care should be taken to avoid contact with skin or eyes. In the case of contact with skin or eyes wash immediately with water. See material safety data sheet(s) and/or safety statement(s) for specific advice.
- Reagents are intended for research use only and are not for use in diagnostic or therapeutic procedures.
- Do not mix or substitute reagents with those from other lots or other sources.
- Do not use kit reagents beyond expiration date on label.
- Do not expose kit reagents to strong light during storage or incubation.
- Do not pipet by mouth.
- Do not eat or smoke in areas where kit reagents or samples are handled.
- Avoid contact of skin or mucous membranes with kit reagents or samples.
- Rubber or disposable latex gloves should be worn while handling kit reagents or samples.
- Avoid contact of substrate solution with oxidizing agents and metal.
- Avoid splashing or generation of aerosols.
- To avoid microbial contamination or cross-contamination of reagents or samples that may invalidate the test, usedisposable pipette tips and/or pipettes.
- Use clean, dedicated reagent trays for dispensing the conjugate and substrate reagent.
- Exposure to acid inactivates the conjugate.
- Glass-distilled water or deionized water must be used for reagent preparation.
- Substrate solution must be at room temperature prior to use.
- Decontaminate and dispose samples and all potentially contaminated materials as if they could contain infectious agents. The preferred method of decontamination is autoclaving for a minimum of 1 hour at 121.5°C.
- Liquid wastes not containing acid and neutralized waste may be mixed with sodium hypochlorite in volumes such that the final mixture contains 1.0% sodium hypochlorite. Allow 30 minutes for effective decontamination. Liquid waste containing acid must be neutralized prior to the addition of sodium hypochlorite.
Preparation of reagents

1. Buffer Concentrates should be brought to room temperature and should be diluted before starting the test procedure.
2. If crystals have formed in the Buffer Concentrates, warm them gently until they have completely dissolved.

Wash buffer (1x)

1. Pour entire contents (50 mL) of the Wash Buffer Concentrate (20x) into a clean 1000 mL graduated cylinder. Bring to final volume of 1000 mL with glass-distilled or deionized water. Mix gently to avoid foaming.
2. Transfer to a clean wash bottle and store at 2° to 25°C. Please note that Wash Buffer (1x) is stable for 30 days.
3. Wash Buffer (1x) may also be prepared as needed according to the following table:

<table>
<thead>
<tr>
<th>Number of Strips</th>
<th>Wash Buffer Concentrate (20x) (mL)</th>
<th>Distilled Water (mL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - 6</td>
<td>25</td>
<td>475</td>
</tr>
<tr>
<td>1 - 12</td>
<td>50</td>
<td>950</td>
</tr>
</tbody>
</table>

Assay buffer (1x)

1. Pour the entire contents (5 mL) of the Assay Buffer Concentrate (20x) into a clean 100 mL graduated cylinder. Bring to final volume of 100 mL with distilled water. Mix gently to avoid foaming.
2. Store at 2–8°C. The Assay Buffer (1x) is stable for 30 days.
3. Assay Buffer (1x) may also be prepared as needed according to the following table:

<table>
<thead>
<tr>
<th>Number of Strips</th>
<th>Assay Buffer Concentrate (20x) (mL)</th>
<th>Distilled Water (mL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 – 6</td>
<td>0.03</td>
<td>2.97</td>
</tr>
<tr>
<td>1 – 12</td>
<td>0.06</td>
<td>5.94</td>
</tr>
</tbody>
</table>

Biotin-Conjugate

Note: The Biotin-Conjugate should be used within 30 minutes after dilution.

For serum and plasma samples, make a 1:100 dilution of the concentrated Biotin-Conjugate solution with Assay Buffer (1x) in a clean plastic tube as needed according to the following table:

<table>
<thead>
<tr>
<th>Number of Strips</th>
<th>Biotin-Conjugate (mL)</th>
<th>Assay Buffer (1x) (mL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 – 6</td>
<td>0.03</td>
<td>2.97</td>
</tr>
<tr>
<td>1 – 12</td>
<td>0.06</td>
<td>5.94</td>
</tr>
</tbody>
</table>

For cell culture supernatant samples, make a 1:200 dilution of the concentrated Biotin-Conjugate solution with Assay Buffer (1x) in a clean plastic tube as needed according to the following table:

<table>
<thead>
<tr>
<th>Number of Strips</th>
<th>Biotin-Conjugate (mL)</th>
<th>Assay Buffer (1x) (mL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 – 6</td>
<td>0.015</td>
<td>2.985</td>
</tr>
<tr>
<td>1 – 12</td>
<td>0.03</td>
<td>5.97</td>
</tr>
</tbody>
</table>

Streptavidin-HRP

Note: The Streptavidin-HRP should be used within 30 minutes after dilution.

Make a 1:100 dilution of the concentrated Streptavidin-HRP solution with Assay Buffer (1x) in a clean plastic tube as needed according to the following table:

<table>
<thead>
<tr>
<th>Number of Strips</th>
<th>Streptavidin-HRP (mL)</th>
<th>Assay Buffer (1x) (mL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 – 6</td>
<td>0.06</td>
<td>5.94</td>
</tr>
<tr>
<td>1 – 12</td>
<td>0.12</td>
<td>11.88</td>
</tr>
</tbody>
</table>
Test protocol

1. Determine the number of microwell strips required to test the desired number of samples plus appropriate number of wells needed for running blanks and standards. Each sample, standard, blank and optional control sample should be assayed in duplicate. Remove extra microwell strips from holder and store in foil bag with the desiccant provided at 2°-8°C sealed tightly.

2. Prepare Biotin-Conjugate (see “Biotin-Conjugate” on page 3).

3. Wash the microwell strips twice with approximately 400 µL Wash Buffer per well with thorough aspiration of microwell contents between washes. Allow the Wash Buffer to sit in the wells for about 10 – 15 seconds before aspiration. Take care not to scratch the surface of the microwells.

After the last wash step, empty wells and tap microwell strips on absorbent pad or paper towel to remove excess Wash Buffer. Use the microwell strips immediately after washing. Alternatively microwell strips can be placed upside down on a wet absorbent paper for not longer than 15 minutes. Do not allow wells to dry.

4. Add 50 µL of Sample Diluent to all wells.

5. Add 50 µL of external diluted standards (see “External standard dilution” on page 3) in duplicate to the corresponding standard wells (see Table 1).

6. Add 50 µL of Calibrator Diluent (for serum or plasma samples) or Sample Diluent (for cell culture supernatant samples) in duplicate to the blank wells.

7. Add 50 µL of Biotin-Conjugate to all wells, including blank wells.

</table>

9. Cover with an adhesive film and incubate at room temperature (18 to 25°C) for 2 hours, on a microplate shaker.

10. Prepare Streptavidin-HRP (see “Streptavidin-HRP” on page 3).

11. Remove adhesive film and empty wells. Wash microwell strips 6 times according to point 3 of the test protocol.

12. Pipette 100 µL of diluted Streptavidin-HRP to all wells, including blanks.

13. Cover with an adhesive film and incubate at room temperature (18 to 25°C) for 1 hour on a microplate shaker.

14. Remove adhesive film and empty wells. Wash microwell strips 6 times according to point 3 of the test protocol.

15. Pipette 100 µL of TMB Substrate Solution to all wells.

16. Incubate the microwell strips at room temperature (18° to 25°C) for about 30 min. Avoid direct exposure to intense light.

The color development on the plate should be monitored and the substrate reaction stopped (see next point of this protocol) before positive wells are no longer properly recordable. Determination of the ideal time period for color development has to be done individually for each assay.

It is recommended to add the stop solution when the highest standard has developed a dark blue color. Alternatively the color development can be monitored by the ELISA reader at 620 nm. The substrate reaction should be stopped as soon as Standard 1 has reached an OD of 0.9 – 0.95.

17. Stop the enzyme reaction by quickly pipetting 100 µL of Stop Solution into each well. It is important that the Stop Solution is spread quickly and uniformly throughout the microwells to completely inactivate the enzyme. Results must be read immediately after the Stop Solution is added or within one hour if the microwell strips are stored at 2 - 8°C in the dark.

18. Read absorbance of each microwell on a spectro-photometer using 450 nm as the primary wave length (optionally 620 nm as the reference wave length; 610 nm to 650 nm is acceptable). Blank the plate reader according to the manufacturer’s instructions by using the blank wells. Determine the absorbance of both the samples and the standards.

Note: Shaking is absolutely necessary for an optimal test performance.

Note: If instructions in this protocol have been followed samples have not been diluted, the concentration read from the standard curve must not be multiplied by a dilution factor.

Calculation of results

- Calculate the average absorbance values for each set of duplicate standards and samples. Duplicates should be within 20 percent of the mean value.

- Create a standard curve by plotting the mean absorbance for each standard concentration on the ordinate against the mouse TNF alpha concentration on the abscissa. Draw a best fit curve through the points of the graph (a 5-parameter curve fit is recommended).

- To determine the concentration of circulating mouse TNF alpha for each sample, first find the mean absorbance value on the ordinate and extend a horizontal line to the standard curve. At the point of intersection, extend a vertical line to the abscissa and read the corresponding mouse TNF alpha concentration.

- Calculation of samples with a concentration exceeding standard 1 will result in incorrect, low mouse TNF alpha levels (Hook Effect). Such samples require further external predilution according to expected mouse TNF alpha values with Sample Diluent in order to precisely quantitate the actual mouse TNF alpha level.

- It is suggested that each testing facility establishes a control sample of known mouse TNF alpha concentration and runs this additional control with each assay. If the values obtained are not within the expected range of the control, the assay results may be invalid.
A representative standard curve is shown in Figure 7.

Note: Do not use this standard curve to derive test results. Each laboratory must prepare a standard curve for each group of microwell strips assayed.

Disposable pipette tips, flasks or glassware are preferred, reusable glassware must be washed and thoroughly rinsed of all detergents before use.

Improper or insufficient washing at any stage of the procedure will result in either false positive or false negative results. Empty wells completely before dispensing fresh wash solution, fill with Wash Buffer as indicated for each wash cycle and do not allow wells to sit uncovered or dry for extended periods.

Performance characteristics

Sensitivity

The limit of detection of mouse TNF alpha defined as the analyte concentration resulting in an absorbance significantly higher than that of the dilution medium (mean plus 2 standard deviations) was determined to be 3.7 pg/ml (mean of 6 independent assays).

Reproducibility

Intra-assay

Reproducibility within the assay was evaluated in 3 independent experiments. Each assay was carried out with 6 replicates of 7 serum samples containing different concentrations of mouse TNF alpha. 2 standard curves were run on each plate. Data below show the mean mouse TNF alpha concentration and the coefficient of variation for each sample. The calculated overall intra-assay coefficient of variation was 6.5%.

Inter-assay

Assay to assay reproducibility within one laboratory was evaluated in 3 independent experiments. Each assay was carried out with 6 replicates of 7 serum samples containing different concentrations of mouse TNF alpha. 2 standard curves were run on each plate. Data below show the mean mouse TNF alpha concentration and the

The OD values of the standard curve may vary according to the conditions of assay performance (e.g., operator, pipetting technique, washing technique, or temperature effects). Furthermore, shelf life of the kit may affect enzymatic activity and thus color intensity. Values measured are still valid.

Limitations

- Since exact conditions may vary from assay to assay, a standard curve must be established for every run.
- Bacterial or fungal contamination of either screen samples or reagents or cross-contamination between reagents may cause erroneous results.
Sample stability

Freeze-Thaw stability
Aliquots of serum samples (spiked) were stored at -20°C and thawed 5 times, and the mouse TNF alpha levels determined. There was no significant loss of mouse TNF alpha immunoreactivity detected by freezing and thawing.

Storage stability
Aliquots of serum samples (spiked) were stored at -20°C, 2-8°C, room temperature (RT) and at 37°C, and the mouse TNF alpha level determined after 24 h. There was no significant loss of mouse TNF alpha immunoreactivity detected during storage at -20°C and 2-8°C.

Specificity
The assay detects both natural and recombinant mouse TNF alpha. The interference of circulating factors of the immune system was evaluated by spiking these proteins at physiologically relevant concentrations into mouse IL-10 positive serum. There was no crossreactivity detected.

Reagent preparation summary

Wash buffer (1x)
Add Wash Buffer Concentrate 20x (50 mL) to 950 mL distilled water.

Mouse TNF alpha standard
Reconstitute lyophilized mouse TNF alpha standard with Calibrator Diluent (serum or plasma samples) or Sample Diluent (cell culture supernatant samples). (Reconstitution volume is stated on the label of the standard vial.)

Test protocol summary
1. Determine the number of microwell strips required.
2. Prepare Biotin-Conjugate.
3. Wash microwell strips twice with Wash Buffer.
4. Add 50 µL Sample Diluent in duplicate, to the all wells.
5. Add 50 µL of externally diluted Standards (see “External standard dilution” on page 3) in duplicate to standard wells.
6. Add 50 µL sample in duplicate, to designated sample wells.
7. Add 50 µL of Calibrator Diluent (for serum or plasma samples) or Sample Diluent (for cell culture supernatant samples) in duplicate to the blank wells.
8. Add 50 µL diluted Biotin-Conjugate to all wells.
9. Cover microwell strips and incubate 2 hours at room temperature (18°C to 25°C) on a microplate shaker.
10. Prepare Streptavidin-HRP.
11. Empty and wash microwell strips 6 times with Wash Buffer.
12. Add 100 µl diluted Streptavidin-HRP to all wells.
13. Cover microwell strips and incubate 1 hour at room temperature (18°-25°C) on a microplate shaker.
14. Empty and wash microwell strips 6 times with Wash Buffer.
15. Add 100 µl of TMB Substrate Solution to all wells.
16. Incubate the microwell strips for about 30 minutes at room temperature (18°C to 25°C).

17. Add 100 µl Stop Solution to all wells.
18. Blank microwell reader and measure colour intensity at 450 nm.

**Note:** Shaking is absolutely necessary for an optimal test performance.

**Note:** If instructions in this protocol have been followed samples have not been diluted, the concentration read from the standard curve must not be multiplied by a dilution factor.
