To ensure the highest cell viability, it is strongly recommended that one should thaw the vial and initiate the cell culture as soon as possible upon receipt. If continued storage of the frozen vial upon receipt is necessary, it should be immediately stored in liquid nitrogen but not at -80°C. Storage at -80°C will lead to significant loss of cell viability. Please read the entire data sheet before thawing. It is recommended that users follow good tissue culture practice. The STAT3 reporter line is sterile and all work should be performed under sterile conditions.

1. Prepare a sterile 15-ml tube with 9 ml fresh medium without selection agents pre-warmed at 37°C.

2. Thaw the STAT3 reporter line quickly in a 37°C water bath, keeping the cap portion out of the water to avoid any possible contamination.

3. Upon thawing, take the vial out of the water and clean it with 70% ethanol to decontaminate.

4. Transfer the cells to the 15-ml tube (Step 1) and mix with medium by gentle inversion of tube.

5. Centrifuge at 1,000 RPM for 5 minutes.

6. Remove supernatant and resuspend reporter cell line pellet in 10 ml of fresh medium without selection agents. It is important to grow the STAT3 cells at this stage without any selection agents.

7. Transfer the reporter line into a 25-cm² tissue culture flask and incubate at 37°C in a 95% air-5% CO2 mixture.

8. After cells settle down (in 1-3 days), remove the medium and replace with fresh complete growth medium containing selection agents.

9. At 70-80% confluency, detach the reporter cells by trypsinization and split into new flasks with fresh complete growth medium.

10. Freeze the STAT3 reporter line at 3~4 x 10^6 cells/ml per cryogenic vial. For optimal viability after freezing, freeze cells when they have reached log phase growth (95-98% confluency). Detach by trypsinization at 37°C for 5 min, and harvest by mixing with 3 volumes of fresh medium followed by centrifugation (Step 5). Resuspend the pellet in freeze media (FBS with 10% DMSO). Add suspension to cryogenic vials in 1 ml aliquots. Place cryogenic vials, in a tissue culture approved cryogenic vial container, in -80°C freezer for 24-48 hours. After 24-48 hours, move the vials into liquid nitrogen storage.
